Question

How to calibrate my 8908-8918 anemometer?

Reply:

AZ anemometer's accuracy for air velocity was programmed in fixed curve, no need and can't be calibrated.

If user would like to check its performance, simply compare it with a standard air flow unit, and when a big deviation in air velocity was found, it means the impeller may be damaged, solution is to contact with local dealer for a new impeller (model no. VP8908SP).
